

Claude Girlie Workout App

Home Page

The Home Page should function as my personal fitness dashboard and daily command center. Every time I open the app, it should immediately answer three questions:

1. What workout should I do next?
2. Am I on track with my workout goals this week and this month?
3. How am I progressing toward my long-term fitness goals?

The page should feel motivating, simple, and action-oriented rather than overwhelming with statistics.

Primary Action

The most prominent element on the page should be a large **Start Workout** button. This button should always remain at the top of the page and launch the Start Workout flow.

Since starting a workout is the primary purpose of the app, this should always be the first action available.

Coach's Recommendation

Directly beneath the Start Workout button, display a personalized workout recommendation generated by the AI coach.

The recommendation should determine which workout is most appropriate based on my workout history and current goals.

When deciding what workout to recommend, prioritize workout balance and recovery.

For example:

- If it has been three weeks since my last Chest & Triceps workout but only one week since my last Back & Biceps workout, recommend Chest & Triceps.
- If I have not yet completed my weekly fun workout (such as Yoga, Pilates, or Hiking), prioritize recommending one of those activities.
- If I have already completed multiple upper-body workouts but no Leg Day this week, prioritize Leg Day.
- Recommendations should always consider how long it has been since each workout type was last completed.

The recommendation should include:

- Workout name
- Estimated workout duration
- A short explanation describing why this workout is being recommended today

Example:

Chest & Triceps

Estimated Time: 60 minutes

Why this workout?

It's been 21 days since your last Chest & Triceps workout, making it the workout you've gone the longest without completing. This keeps your training balanced and supports steady muscle growth.

Weekly Workout Goals

Display a checklist showing my progress toward my weekly workout goals.

My weekly goal is to complete:

- At least 1 Leg Day
- At least 1 Upper Body Weightlifting Workout
- At least 1 Cardio Workout
- At least 1 Fun Activity (Yoga, Pilates, Hiking, etc.)

This creates a goal of four workouts each week.

Each checklist item should display:

- Completion status
- The date it was completed (if already completed)
- If incomplete, the date it was last completed
- If it is currently the highest-priority recommendation, visually highlight it as **Recommended**

Example:

- ☒ Leg Day — Completed Jul 1
- ☐ Upper Body — Last completed Jun 10 • Recommended
- ☒ Cardio — Completed Jul 2
- ☐ Fun Activity — Last completed Jun 18

Below the checklist, display a weekly progress bar showing progress toward completing all four workout categories.

Example:

Weekly Goal

2 / 4 workouts completed

Monthly Workout Goal

Display a second progress section tracking my monthly consistency goal.

My goal is to complete 18 workouts each month.

Display:

- Current workout count
- Monthly goal
- Progress bar

Example:

7 / 18 workouts completed

This section should motivate consistency over the course of the month while remaining separate from the weekly workout category checklist.

Workout Streak

Display my current consistency streak.

The streak should represent consecutive weeks where I successfully completed all four weekly workout goals.

Display:

- Current streak
- Longest streak

Example:

Current Streak

9 consecutive weeks

Longest streak: 14 weeks

This should celebrate consistency rather than perfection.

Recent Wins

Display my three most recent achievements.

These should automatically update as I reach new milestones.

Examples include:

- New personal records
- Completing a weekly goal
- Longest run
- New heaviest weight for an exercise
- Fastest pace
- Completing a milestone number of workouts
- Reaching a long workout streak

Only display the three most recent achievements to keep this section clean and meaningful.

Coach's Insight

Near the bottom of the page, display one personalized insight generated by the AI coach.

This insight should be based on trends in my workout history and should always be factual, encouraging, and personalized.

Examples:

- You've completed 85% of your planned workouts over the past six months.
- Your squat has increased by 50 pounds since you started using the app.
- You've completed a Leg Day every week for the past two months.
- Your consistency has improved every month this year.

Avoid generic motivational quotes.

Insights should always reference my actual progress and encourage long-term consistency.

Overall Design Philosophy

The Home Page should feel like opening an app designed by a knowledgeable personal trainer rather than a data dashboard.

The focus should always be on helping me answer three questions:

- What should I do next?
- Am I staying consistent?
- Am I making progress?

The page should feel clean, motivating, and actionable, with the Start Workout button remaining the primary focus.

Goals & Milestones Page

The Goals & Milestones page should serve as my long-term fitness roadmap. Its purpose is to help me visualize where I started, where I am today, and where I'm working toward across each of my primary workout categories.

This page should feel motivating, rewarding, and progress-focused rather than simply displaying numbers.

The AI Coach should use this page as one of its primary sources when generating workout recommendations, exercise progression, and long-term planning.

Page Organization

Organize the page into the same workout categories used throughout the app:

- Glutes & Legs
- Chest & Triceps
- Back & Biceps
- Abs
- Cardio

Each category should appear as a collapsible card.

Each exercise can be assigned a priority level:

- High Priority
- Medium Priority
- Low Priority

The AI Coach should consider these priorities when generating future workout recommendations and exercise progression.

Category Summary

Before expanding a category, display a high-level summary including:

- Category name
- Overall progress across all active goals

- Number of active goals
- The next goal projected to be completed

Example:

Glutes & Legs

Overall Progress

64%

5 Active Goals

Next Projected Goal

Hip Thrust

Expanded Category

When expanded, each category should display a short explanation describing why this category is important to my overall fitness goals.

Example:

Building stronger glutes and legs is my highest fitness priority. Improving strength across these exercises supports muscle growth, lower body strength, and overall athletic development.

Exercise Goals

Each exercise should display:

- Exercise name
- Starting weight
- Current best
- Goal
- Progress bar
- Numerical progress
- Priority
- Milestones
- AI Goal Forecast

Example:

Barbell Squat

Started

95 lb

Current Best

145 lb

Goal

200 lb

Progress

50 / 105 lb

48%

Milestones

✓ 135 lb

✓ 155 lb
 175 lb
200 lb

AI Forecast

At your current rate of progress, you are projected to reach this goal in approximately 7 months.

Progress should always be calculated using my best recorded performance for that exercise rather than my most recent workout.

This ensures occasional off-days do not reduce my displayed progress.

Goal Progress

Progress should always be displayed relative to where I started.

For example:

Started: 95 lb

Current Best: 145 lb

Goal: 200 lb

Progress:

50 / 105 lb

48%

This makes long-term progress easy to understand at a glance.

Adding New Goals

Provide an **Add Goal** button.

Support two methods for creating new goals.

Option 1 — Create Manually

Allow me to:

- Choose a workout category
- Select an exercise
- Enter a goal

Option 2 — Ask the AI Coach (Recommended)

I can describe my fitness goals in natural language.

Examples:

"I want bigger glutes."

"I want to improve my running."

"I want stronger legs."

The AI Coach should recommend realistic long-term exercise goals based on:

- my current strength
- my workout history
- my category priorities
- my long-term fitness goals

I should be able to:

- Accept

- Customize
- Decline

the suggested goals before saving them.

Goal Milestones

Each exercise goal should automatically generate milestone checkpoints between my starting point and my final goal.

Milestones should be meaningful and realistic rather than evenly spaced.

For example, if my squat goal is 200 lb, milestones might include:

- 135 lb
- 155 lb
- 175 lb
- 200 lb

These milestones should provide regular moments of celebration throughout long-term goals.

AI Goal Forecast

Each exercise should display an estimated completion forecast.

Example:

At your current rate of progress, you are projected to reach this goal in approximately 7 months.

The forecast should automatically update as new workouts are completed.

AI Goal Recommendations

The AI Coach should proactively recommend new goals whenever appropriate.

Examples include:

- after completing an existing goal
- when I am close to completing a goal
- when my progress suggests a more ambitious goal has become realistic

Example:

Congratulations! You reached your Barbell Squat goal of 200 pounds.

Based on your recent progress, I recommend increasing your next goal to 225 pounds.

Provide three options:

- Accept
- Customize
- Later

The AI Coach should never automatically replace an existing goal without my approval.

Hall of Fame

Completed goals should never disappear.

Instead, move them into a permanent **Hall of Fame** section at the bottom of the

page.

Examples:

- Barbell Squat — 135 lb
- Barbell Squat — 185 lb
- Hip Thrust — 225 lb
- First 5K
- 100 Workouts Completed

The Hall of Fame should serve as a permanent record of my accomplishments and remind me how much progress I've made over time and it should tell me the dates on which I accomplished each of these goals.

Overall Design Philosophy

The Goals & Milestones page should focus on long-term progress rather than simply tracking numbers.

Every goal should answer three questions:

- Where did I start?
- Where am I now?
- Where am I going?

The page should make progress feel visible, celebrate milestones along the way, and help the AI Coach continuously guide me toward my next achievement.

Past Workouts

The Past Workouts Page is the detailed historical record of every completed workout.

It should serve as a structured training journal that allows me to review exactly what I did in each workout, including exercises, sets, weights, performance, and AI-generated insights.

This page is the deepest level of workout data in the system and should feel like a coaching logbook rather than a simple activity list.

Core Concept: Workout Object

Each past workout is a complete structured object containing:

- Workout type (e.g. Glutes & Legs, Chest & Triceps)
- Date
- Duration

- Status (Completed)
- Exercises performed
- Set-by-set performance data
- AI-generated summary
- Progression insights

Each workout should be fully expandable.

Page Structure

Default View (Workout List)

Display workouts in reverse chronological order (newest first).

Each workout preview card should include:

- Workout type
- Date
- Duration
- Number of exercises
- High-level summary of progress (1–2 lines)
- Indicators for:
 - PRs achieved
 - weight increases
 - milestone progress

Example:

Glutes & Legs

July 2, 2026

65 min

5 exercises

+ Squat PR achieved

"Steady progression in squat and hip thrust volume with increased working weight."

Expanded View (Workout Detail)

Clicking a workout expands it into full detail view.

Workout Detail Layout

Each workout contains:

1. Workout Header

- Workout type
- Date
- Duration
- Overall AI summary

AI Summary should include:

- what improved
- what was maintained
- what was intentionally not progressed
- how this workout supports long-term goals

Example:

"You increased your squat weight while maintaining rep quality across all working sets. Hip thrusts were held steady to reinforce form. Overall training volume increased slightly, supporting your glute growth goal."

2. Exercise Breakdown

Each exercise is displayed as an exercise card.

Each exercise card includes:

Exercise Name

Movement Category (if applicable)

Set Structure Table

Each set includes:

- Set number
- Weight (or cardio metric)
- Reps
- Whether it matched recommendation
- Notes (optional)

Example:

Barbell Squat

Set 1 → 95 lb × 8 (recommended: 95 × 8)

Set 2 → 135 lb × 8 (recommended: 135 × 8)

Set 3 → 150 lb × 6 (recommended: 150 × 6–8)

3. Progress Indicators (per exercise)

Each exercise should show:

- Change vs last workout
- Whether weight increased
- Whether reps increased
- Whether progression goal was met

Example:

Progress:

+5 lb increase from last session

Reps maintained within target range

4. AI Coaching Insight (per workout)

Each workout should include a coaching summary.

This should be short and structured:

- What improved
- What stayed consistent
- What is next focus

Example:

"You successfully progressed your squat while maintaining form quality. Next session, the focus will be on increasing rep consistency at the new weight."

Search & Filtering

Users should be able to filter workouts by:

- Workout type
- Muscle group category
- Date range
- PR achievements
- Cardio vs strength vs fun workouts

Key Insights Layer (Global)

At the top of the page, include a persistent insights section:

Examples:

- Total workouts completed
- Most improved exercise
- Longest consistency streak
- Most frequent workout type

Connection to Other Pages

This page must integrate with:

- Start Workout Flow → creates entries here
- Calendar Page → visual representation of these workouts
- Goals Page → updates progress toward goals
- Home Page → influences recommendations

Design Philosophy

The Past Workouts Page should feel like a personal training journal that answers:

- What exactly did I do in each workout?
- How did I improve over time?
- What patterns is the AI Coach seeing in my training?

It should emphasize:

- clarity
- progression tracking
- transparency of performance
- reinforcement of long-term goals

It should never feel like a raw data dump.

Calendar

The Calendar Page is the system's visual source of truth for all workouts. It displays completed workouts, planned workouts, missed workouts, and AI-suggested future workouts.

It should function as a hybrid between:

- a training history timeline
- a lightweight planning system
- a behavioral pattern tracker

The goal is to help me understand:

- what I have done
- what I planned to do
- what I should do next
- how my training patterns are evolving over time

The Calendar must feel like a coach organizing my training life, not a rigid scheduling tool.

Core Concept: Workout Events

Every item on the calendar is a Workout Event.

A Workout Event has 4 possible states:

1. Planned

A workout suggested or scheduled by the AI Coach that has not yet been started.

- Display: outlined version of category color
- Can be edited or rescheduled
- Represents intent

2. In Progress

A workout currently being performed.

- Display: active state
- Only one can exist at a time

3. Completed

A workout that has been fully logged.

- Display: solid filled category color
- Immutable except for viewing details

4. Missed

A planned workout that was not completed.

- Display: faded / desaturated outline version
- Triggers AI rescheduling behavior. Once this workout is rescheduled, the missed workout is removed and is moved as a new event to the rescheduled date.

Color System

The calendar uses a two-level color system:

Level 1: Category (base color family)

- Weightlifting → Color A (primary weightlifting color family)
- Cardio → Color B (primary cardio color family)
- Fun / Lifestyle → Color C (primary fun activity color family)
- Recovery / Maintenance → Color D (light neutral family)

Level 2: Subtype (shades within category)

Weightlifting (Color A shades)

- Glutes & Legs → A1
- Chest & Triceps → A2
- Back & Biceps → A3
- Abs → A4

Cardio (Color B shades)

- Running → B1
- Incline Walking → B2
- Stairs → B3
- Swimming → B4
- Cycling → B5

Fun / Lifestyle (Color C shades)

- Yoga → C1
- Pilates → C2
- Pickleball → C3
- Hiking → C4

Recovery / Maintenance (Color D shades)

- Mobility Work → D1
- Stretching → D2
- Light Walk → D3
- Rehab Work → D4

This system must remain consistent across the entire app:
Home Page, Calendar, Workout Flow, and Goals Page.

AI Scheduling System

The AI Coach can create future planned workout events automatically.

It should:

- suggest workouts based on past behavior
- maintain weekly balance goals
- prioritize overdue workout categories
- learn repeating behavioral patterns

Example:

If I play pickleball every other Monday, the system should learn this pattern and begin suggesting pickleball every other Monday.

All AI-generated scheduled events must remain editable.

Missed Workouts

If a planned workout is not completed, it is marked as Missed.

When this happens:

The AI Coach should prompt:

"You missed your planned workout. Please select a new date to reschedule it."

User must be able to:

- select a new date using a calendar date picker
- confirm reschedule

No additional options should be shown. The interaction should remain simple and focused on selecting a new date.

Calendar Views

Monthly View (Primary)

- Full month grid
- Displays all workout events
- Uses color-coded blocks with state indicators

Weekly View (Secondary)

- Focused view of current week
- Shows weekly goal completion status
- Reinforces 4-workout structure:
 - 1 Leg Day
 - 1 Upper Body Day
 - 1 Cardio Day
 - 1 Fun Workout

Hover / Tap Interaction

Hovering or tapping a workout event displays:

- Workout type
- Category
- Date
- Status (Planned / Completed / Missed / In Progress)
- Duration
- Short AI-generated summary (1–2 sentences)

Weekly Goals Section

Displayed at the bottom of Weekly View.

Shows:

- Progress toward 4 weekly workout categories
- Checklist:
 - Leg Day
 - Upper Body
 - Cardio
 - Fun Activity

Each item shows:

- completion status
- last completed date (if not completed this week)
- recommended status if AI prioritizes it

Monthly Summary Section

Displayed below Monthly View.

Includes:

- Total workouts completed
- Breakdown by category (pie chart or bar chart)
- Average workouts per week
- Completion rate (% of planned workouts completed)
- Distribution of workout types

AI Recommendation Layer

The Calendar should visually highlight the AI Coach's recommended next workout.

The recommendation is based on:

- time since last workout per category
- weekly goal completion status
- overall training balance
- recovery needs

The recommended workout should be subtly highlighted in the calendar.

Connection to Other Pages

The Calendar must stay synchronized with:

- Home Page → recommendations and weekly goals
- Start Workout Flow → creation of completed events
- Goals & Milestones Page → long-term progression tracking
- Past Workouts Page → detailed workout history

The Calendar is the system's temporal source of truth.

Design Philosophy

The Calendar should feel like:

- a visual story of my fitness behavior
- a dynamic training planner
- a coach actively organizing my week

It should never feel like a rigid scheduling tool.

The system should prioritize:

- consistency
- adaptability
- behavioral learning
- simplicity of interaction

Progress & Milestones

The Progress & Milestones page should provide a simple, motivating overview of the user's long-term progress. It should primarily focus on where the user has been while highlighting meaningful achievements and trends.

Overview

At the top of the page, Alex should provide one concise insight summarizing the user's recent progress.

Examples:

- "Your squat has increased by 20 lb over the last 100 days."
- "Your consistency has been your biggest strength this month."
- "You're only 10 lb away from reaching your squat goal."

Progress Sections

Goal Progress

Display progress toward active goals using progress bars.

Each goal should show:

- Current progress
- Goal
- Percentage complete

Strength Progress

Display simple line graphs showing strength progression over the last 100 days for major exercises.

Consistency

Show:

- Current workout streak
- Monthly workouts completed
- Weekly workout completion
- Workout frequency over the last 100 days

Workout Balance

Show a breakdown of workouts completed by category over the last 100 days.

Include:

- Glutes & Legs
- Chest & Triceps
- Back & Biceps
- Abs
- Cardio
- Fun Exercise
- Recovery & Maintenance

Body Weight

Track body weight over time using a simple line graph covering the last 100 days.

Personal Records

Display current personal bests for strength and cardio exercises.

Milestones

Display meaningful milestones in chronological order, such as:

- Goals achieved
- Personal records
- Long workout streaks
- 100th workout
- Other significant accomplishments

Design Principles

- Keep the page clean and easy to scan.
- Highlight long-term trends rather than daily fluctuations.
- Celebrate meaningful progress instead of gamifying every achievement.
- Focus on motivation through visible improvement rather than excessive statistics.

Start Workout Flow

The "Start Workout" experience should function as an AI personal trainer rather than a simple workout logger. Its primary purpose is to generate a personalized workout recommendation based on my previous workouts, guide me through completing it, and then save my actual results so future recommendations become smarter.

Step 1: Select Workout Type

When I click **Start Workout**, first ask me to choose a workout type.

Initial workout types include:

- Weightlifting – Leg Day
- Weightlifting – Chest & Triceps
- Weightlifting – Back & Biceps
- Cardio (Running or Stairs)
- Fast Walk
- Yoga
- Pilates
- Pickleball
- Other

If I create a new workout type using **Other**, it should automatically become a permanent option for future workouts.

Weightlifting Philosophy

My primary fitness goal is maximizing glute growth while building muscle throughout my body and maintaining a consistent workout routine.

The recommendation engine should follow evidence-based hypertrophy principles using progressive overload.

A workout is considered successful when all prescribed working sets are completed within the target rep range using good form.

Progression should generally work as follows:

- Increase weight once the previous workout's target reps were successfully completed.
- If target reps were not achieved, recommend the same progression again during the next workout.
- Increase training volume gradually while avoiding excessive fatigue.
- Recommend small weight increases that are realistic for the specific exercise.
- Always explain why today's recommendation differs from the previous workout.

Workout Generation

After selecting a weightlifting workout, automatically generate today's recommended workout.

Begin with an AI Workout Brief summarizing:

- today's overall focus
- what is being progressed
- what stayed the same
- any exercise substitutions
- why those decisions were made

Example:

"Today's focus is building glute strength by progressing your squats while adding variety to your accessory work. Since you completed all squat sets last workout,

today's recommendation slightly increases the working weight. Bulgarian split squats have been replaced with walking lunges to maintain variety while still training the same movement pattern."

Workout Structure

Each weightlifting workout should contain:

- 5 strength exercises
- 1 short ab routine

I should always be able to:

- remove any recommended exercise
- add a different exercise
- reorder exercises

When adding an exercise, recommendations should be filtered to exercises appropriate for that workout type.

Movement Categories

Exercises should belong to movement categories rather than existing independently.

For Leg Day, always include one exercise from each category:

- Squat/Lunge
- Hip Hinge
- Hip Thrust / Bridge
- Glute Abduction

The fifth exercise should rotate between categories such as:

- Hamstring Isolation
- Glute Isolation
- Single-Leg Stability
- Adductors
- Calves

The recommendation engine should rotate exercises over time to provide variety while ensuring balanced glute development.

If I consistently remove certain exercises, learn my preferences and recommend those exercises less often while still maintaining balanced programming.

Exercise Card

Each exercise should appear in its own card.

Each card should include:

Exercise Name

Movement Category

Reason it was selected

Warm-up Set (1 recommended warm-up set)

Working Sets

For working sets, display a table with:

- Set Number
- Recommended Weight
- Actual Weight
- Recommended Reps
- Actual Reps

Default to three working sets with the ability to add more.

Recommended values should be pre-filled but editable.

Actual values should be entered separately so recommendations and workout history remain distinct.

The card should also display:

- Last workout performance
- Why today's recommendation changed (or stayed the same)
- Long-term goal for this exercise

Example:

Last Workout

95 × 8

135 × 8

145 × 6

Today's Recommendation

Warm-up

45 × 10

Working Sets

95 × 8

135 × 8

150 × 6–8

Reason

You completed your previous working sets successfully, so today's recommendation increases the final working weight by 5 pounds while maintaining the target hypertrophy rep range.

Long-Term Goal

185 × 8

Cardio Workouts

Cardio workouts should also generate recommendations based on previous workouts.

Running should ask for:

- Indoor or Outdoor
- Time
- Distance

Recommendations should gradually progress either distance or pace depending on previous performance and include an explanation.

Other Workout Types

Yoga, Pilates, Pickleball, and similar activities do not require workout recommendations.

For these workouts, simply record:

- Duration
- Optional notes

Workout Completion

After the workout is finished, save all actual workout data.

Immediately generate an AI Workout Recap summarizing:

- exercises progressed
- personal records achieved
- improvements from previous workouts
- total workout volume
- how today's workout supports my long-term goals

This summary should feel like feedback from a knowledgeable personal trainer rather than a generic success message.

Foundational Documents

Alex – AI Coach System Prompt

You are **Alex**, the user's personal AI fitness coach.

Your primary mission is to help the user enjoy working out and stay consistent long-term. Every recommendation should support those goals.

Personality

- Be knowledgeable, friendly, and confident.
- Sound like an experienced personal trainer.
- Keep responses concise and conversational.
- Use light humor occasionally, including gently teasing the user when they've been slacking, but never shame or guilt them.
- Celebrate meaningful milestones and progress, not every workout.

Coaching Principles

- Prioritize consistency over perfection.
- Base recommendations on the user's workout history, goals, preferences, and recent performance.
- Learn from the user's behavior and adapt future workout

recommendations accordingly.

- Recommend evidence-based exercise progression that is safe and effective for building strength and muscle.
- When you don't have enough information, say so and continue learning from future workouts rather than making assumptions.

Communication

- Keep explanations brief and practical.
- When making a recommendation, include a short explanation of why.
- Praise specific achievements instead of giving generic compliments.
- Offer one meaningful insight after completed workouts that helps the user recognize progress or identify an area for improvement.

Never

- Shame or guilt the user.
- Exaggerate results or make unrealistic promises.
- Overwhelm the user with unnecessary scientific detail.
- Be overly enthusiastic or use trendy slang.

Workout Playbook

This document defines the evidence-based principles Ron follows when generating workouts and recommending progression.

Primary Objective

The primary goal is to maximize muscle growth while helping the user stay consistent long-term.

Every workout should balance progression, variety, and recovery. Progress should never come at the expense of movement quality or long-term consistency.

Workout Structure

Weightlifting workouts should typically contain:

- 5 exercises (4–6 if it better fits the workout)
- An optional ab routine when appropriate

Exercises should be selected based on movement patterns, not individual exercises. Every workout should include at least one exercise from each required movement pattern.

Glutes & Legs

Include at least one exercise from each category:

- Squat / Lunge / Single-Leg
- Thrust / Bridge
- Hinge / Pull
- Abduction
- Knee Flexion / Calves

Chest, Shoulders & Triceps (Push)

Include at least one exercise from each category:

- Horizontal Push

- Vertical Push
- Triceps Isolation
- Chest Isolation
- Shoulder Isolation

Back & Biceps (Pull)

Include enough exercises to create a balanced workout while including at least one of each:

- Vertical Pull
- Horizontal Pull
- Biceps Isolation

Exercise selection should prioritize the user's goals. For example, if glute growth is the highest priority, choose exercise variations that emphasize glute development while maintaining balanced training.

Exercise Selection

Use a stable foundation with rotating accessory exercises.

Prefer progressing an exercise before replacing it.

Do not generate identical workouts every week, but do not introduce unnecessary variety simply for the sake of change.

Rotate exercises when it improves training quality, motivation, or addresses stalled progress.

Strength Progression

Follow a double progression model for hypertrophy.

Rep ranges:

- Compound lifts: 5–8 or 6–10 reps
- Machine compounds: 8–12 reps
- Isolation exercises: 10–15 reps
- Lateral raises, calves, and abs: 12–20 reps

Only increase weight after all working sets reach the top of the target rep range with good form.

If all working sets reach the top of the range:

- Increase weight next session.

Otherwise:

- Keep the same weight.
- Aim to improve total reps from the previous workout.

If progress stalls for 3–4 consecutive sessions:

- Recommend a small deload or fatigue reduction before attempting further progression.

Always prioritize movement quality before progression.

Do not recommend progression when:

- Form breaks down.
- Rep targets are missed.

- The user voluntarily reduces weight.
- The user is returning after a long break.

Cardio Progression

Progress cardio using appropriate metrics for the activity, including:

- Time
- Distance
- Pace

The primary objective is gradual improvement while maintaining consistency.

Recovery & Scheduling

Avoid training the same primary muscle group on consecutive workouts.

Whenever possible, allow at least four days before training the same primary muscle group again.

Balance weekly training across all workout categories while respecting the user's schedule and recovery.

General Principles

- Prioritize movement quality before increasing weight.
- Base recommendations on the user's goals, workout history, preferences, and recent performance.
- Keep progression gradual and sustainable.
- Avoid recommending unnecessary exercise changes.
- Never sacrifice technique for heavier weight.
- Build workouts that are both effective and enjoyable enough to support long-term consistency.

Design Philosophy

The app should feel premium, organized, modern, intelligent, and subtly playful. It should prioritize simplicity and reduce decision fatigue, allowing the user to focus on working out instead of managing workouts.

Core Principles

- Minimize typing by preferring buttons, checkboxes, dropdowns, and pre-filled recommendations.
- Show recommendations before asking the user for input. Alex recommends; the user decides.
- Keep information progressive. Show only what's most important first, with additional details available on demand.
- Every screen should have one clear primary action.
- Make progress visible through milestones, progress bars, streaks, and

simple charts.

- Personalize over time instead of requiring extensive configuration.
- Recommendations should always be editable.
- Maintain a consistent design language across the entire app.

Visual Design

- Design primarily for dark mode.
- Use a clean, premium, data-focused interface inspired by WHOOP.
- Use neutral colors throughout the UI with intentional accents of burgundy, deep red, and purple.
- Workout categories should use the predefined color system.
- Prefer cards over dense lists or tables.
- Keep charts simple, clean, and easy to understand.
- Use subtle, polished animations with occasional 3D effects where they enhance the experience.
- Alex should only appear when providing recommendations or coaching insights.

User Experience

The app should always guide the user toward the next best action. Every interaction should feel effortless, intentional, and focused on helping the user stay consistent and enjoy working out.

Onboarding Philosophy

The purpose of onboarding is to collect only the information necessary to generate a personalized first workout. It should be fast, guided, and require minimal typing.

Core Principles

- Keep onboarding short and focused.
- Prefer multiple choice questions, checkboxes, sliders, and dropdowns over free-text inputs.
- Ask only for information that immediately improves workout recommendations.
- Allow users to skip non-essential questions and let Alex learn those preferences over time.
- Explain why each question is being asked when it helps build trust.
- End onboarding with a personalized game plan and the user's recommended first workout.

Learning Over Time

Onboarding is only the starting point.

Alex should continuously learn from the user's workouts, preferences, and behavior to personalize future recommendations without repeatedly asking for additional information.

The app should become smarter through use rather than through a lengthy setup process.

Memory & Learning System

This document defines what Alex remembers, what Alex learns over time, and how that information is used to provide better coaching.

Guiding Principle

Alex should only remember information that helps generate better future workout recommendations. The goal is to continuously personalize coaching while keeping recommendations effective, enjoyable, and aligned with the user's goals.

Permanent Memory

Never forget unless the user explicitly changes it.

- Long-term fitness goals
- Current strength levels
- Goal progress
- Preferred workout frequency
- Long-term workout preferences

Adaptive Memory

Continuously update based on the user's behavior.

Learn:

- Favorite exercises
- Exercise substitutions
- Preferred workout length
- Workout schedule and consistency patterns
- Typical progression rate
- How aggressively the user likes to progress
- Current working weights
- Exercise performance trends

Infer preferences from consistent behavior rather than isolated events.

Short-Term Memory

Use recent history to influence recommendations.

Track:

- Last 2 workouts for each workout type
- Recent progression
- Recent missed workouts
- Recent milestones

Workout recommendations should primarily consider recent history, while long-term progress should consider the user's entire workout history.

Forgetting

Recent behavior should outweigh old behavior.

Gradually forget:

- Outdated workout habits
- Old scheduling patterns
- Exercises the user no longer performs regularly
- Old strength levels that no longer reflect current ability

Do not permanently stop recommending an exercise unless the user consistently skips or replaces it over time.

Goal Management

When a goal is achieved, proactively recommend an appropriate next goal based on the user's progress and long-term objectives.

Optimization

Alex should continuously learn what workout structure, progression rate, and exercise selection best help the user maximize muscle growth while enjoying workouts enough to stay consistent.
